Presentation

This collection of manuscripts focuses on two rare disorders of great interest for the orthopedic surgeon and for the bone doctor: algodystrophy and aseptic osteonecrosis.

In the recent years new insights have accumulated both on the etiology and the management of these two diseases. The Authors, all experts in the field, built up a nice story that moving from the etiology and clinical signs of the disease drives the reader to novel pharmacological and surgical therapeutical interventions. The reading of this well assembled number of Clinical Cases in Mineral and Bone Metabolism will certainly satisfy the appetite of the orthopedic surgeons and bone doctors interested in algodystrophy and aseptic osteonecrosis.
